

TABWARE FOR THE UPSTREAM, MIDSTREAM & DOWNSTREAM OIL & GAS INDUSTRIES

The Oil & Gas industry is challenged with effectively maximizing asset performance, increasing uptime and controlling costs. In the Upstream Drilling and Exploration sectors, Asset movements must be accurately tracked to capture their location and record whether they are installed or operational, and that can be extremely difficult when those assets and equipment continuously transfer between rigs, areas, divisions and countries. Because those assets are essential to production uptime, Preventive Maintenance (PM) schedules for these assets must also be available based on operational time in addition to calendar days or meter values. Midstream operations have additional concerns because they could have movable assets which complicate equipment tracking and maintenance. Downstream, refineries cannot afford unplanned outages, due to the high cost of downtime, and they strive to manage planned turnaround projects with minimal time and cost. All sectors within Oil & Gas must also deal with health, safety and environmental (HSE) management issues.

With roots in the Oil & Gas industry, TabWare Computerized Maintenance Management System/Enterprise Asset Management (CMMS / EAM) solution helps customers maintain their vital assets that are crucial to production uptime and avoid complicated, costly and catastrophic equipment failures.

TabWare was designed by maintenance professionals with extensive experience working with major Oil & Gas organizations and uniquely combines robust functionality specific to the industry with configurability, ease-of-use and advanced technology. Unlike any other CMMS / EAM solution, TabWare specifically helps the Oil & Gas industry:

- Maximize asset performance through analytics dashboards that quickly show KPIs, including the health of your assets, maintenance costs, equipment downtime and inventory, with drilldown capability to spot areas of concern and quickly get to the details.
- Manage maintenance costs through effective work planning and scheduling, easy review and approvals of work orders, projects, requisitions and purchase orders, integrated spare parts inventory management and streamlined requisitions that use your negotiated pricing with internet-based vendor catalogs.
- Improve operations by analyzing equipment breakdown information, tracking PM program compliance, facilitating planned maintenance and improving communications between maintenance and manufacturing.
- Ensure regulatory and HSE compliance through comprehensive event tracking and manage follow up activities from events such as accidents, emissions and spills.
- Pre-plan work for turnaround activities, conduct “what if” scheduling scenarios and handle turnaround material requirements, including long lead time items with integrated purchase order tracking software.

AssetPoint has extensive experience in the Upstream, Midstream and Downstream Oil & Gas sectors, with customers involved in drilling, exploration, product transportation, refining and production. TabWare CMMS / EAM is trusted by Oil & Gas organizations to provide the information needed to maximize asset performance, control maintenance costs and improve operations, leading to increased productivity and profitability.
